

Welcome to VistaDictation.com!

Voice Recognition is here and it is already on your Vista and Windows 7 Operating Systems

Save \$15,000 compared to hiring a transcriptionist You don't need additional software. You just need a Medical or Legal Vocabulary

We also offer [MedTemps EMR](#) for all of you looking for a practical and accurate way to organize your Electronic Medical Records

If you have any questions or would like to place your order now, don't hesitate to call!

Call us toll free: 1-888-775-1683

If you are currently paying for transcriptions... Simply take a glance and compare!

Windows Speech Recognition with Trigram Technologies Vocabulary

Transcriptionist

Average cost per year per doctor

\$299

Only Once! And Comes with free tech support from us, the experts!

\$15,000

Average turnaround time per dictation:

Instant

48 hours to a week

Are you looking for an accurate and affordable way to dictate your transcriptions?

Do you already have Windows Vista or Windows 7 (both 32 and 64-bit)?

Windows Speech Recognition: Voice Recognition Software for Microsoft Vista and Windows 7 is better than ever!

If you've answered yes to the above questions, which most of you looking at this article have, then you already have one of the most powerful voice recognition systems available. All you need is the basic Home version (or higher) of Vista or Windows 7 in combination with a Trigram Technologies MedTopics medical vocabulary. Your dictations will become as easy as speaking , and you will no longer have the need for transcription services!!! Microsoft has invested many millions of dollars in research regarding voice recognition over the last few years. Obviously, some of the R&D going in to speech and voice recognition is years away form the market, but if you're thinking of purchasing some of the high end software at a costly price, then think again, because you don't have to! For those of you who don't have Microsoft Windows Vista, the overall cost of upgrading your operating system and purchasing a third party vocabulary or software is still less than the out of the box solutions from the larger transcription software companies.

Now, many of you have probably seen the skepticism around Microsoft's blunder of an introduction of Vista Speech (WSR for Vista) when it first came out last year, but don't let that make you hesitant. Most of the capabilities you're looking for in the high end software are built in to the voice recognition software that you already own! The only thing missing is the integration of a base vocabulary, contextual knowledge and phonetics. That's it! Trigram Technologies offers both Legal (coming out in 2011) and Medical vocabularies upwards of

30,000 words a piece. The medical vocabulary has over 40 medical specialties to choose from. The reason for Microsoft Windows Speech Recognition's lack of intrinsic capabilities is that in order to preserve memory and overall processor speed, there's no way Microsoft can manufacture a set of vocabularies that will encompass everyone's needs, especially in the medical industry. We're talking hundreds of thousands of words for just a general medical or legal practice; likewise in trying to encompass a well rounded vocabulary for the general public! Not to worry, there's a third party company, Trigram Technologies, which provides the vocabularies for all of us!!! Read more about [Trigram Technologies here](#).

Windows Speech Recognition (WSR) is a fantastic feature for those who require or even just desire the ability to dictate and transcribe hands free. WSR works in virtually any application or dialog box you can type text into. WSR can take dictation from you, and transcribe it directly to your PC with out all of the costs that transcriptionists and transcription services require. Now, since Vista Speech is already built in to your Microsoft Windows Vista operating system, one can't immediately expect to have the same effect as those other leading brands promise from an upwards of \$2000 per licensing of the software... but not to worry. WSR has great capabilities and is lacking in only one thing: The implementation of a large vocabulary which links those recognition algorithms to our speech patterns and our language! Metaphorically, it's as if the algorithm is the foundation of a bridge, and the vocabulary would be the planks. Vistadictation provides the combination of the speech algorithms with the contextual basis of the vocabulary, and we finally achieve the basis for an accurate voice recognition software. You simply need to implement the Trigram Technologies MedTopics to have a fully functional AND accurate dictation software.

Windows Speech Recognition with Trigram Technologies' MedTopics is fast and easy...

There's nothing complicated to enable dictation. If the cursor is in a text-entry box, simply talk and it types! It works in most web forms, email programs, word processors, you name it (like some of the major transcription software, it has been manufactured with the Microsoft Suite in mind). Dictating to your computer is part science fiction, and part art. Acclimating yourself to make this as natural as possible takes a little getting used to, but is ultimately quite easy. At a glance, understandably, the voice recognition software appears to be a bit rudimentary. It gets better over time as you "train" the software to your voice, but you can gain accuracy right from the very beginning by running the training option in the speech control panel. You'll read a set of sentences, and WSR will listen to your voice and adapt it's algorithms to improve its understanding of what you dictate. They say it takes 5 to 10 minutes, but it tends to be more on

the order of 30 minutes. The initial nominal increment of time is not only necessary, but well worth it due to it's ability to increase your accuracy. A general rule of thumb is to do as much training as possible. If you ever notice any inaccuracy or feel like there can be improvement elsewhere, please continue with the training features in WSR. To activate Trigram Technologies' Medical Vocabulary, simply run the executable file (.exe) you've purchased from VistaDictation.com, and follow the simple step by step prompt windows. See our [How-To](#) page for further assistance.

Windows Vista and Windows 7 Operating Systems ALREADY HAVE VOICE RECOGNITION!!! All you need is a MEDICAL or LEGAL VOCABULARY!
